Inputs
Computational protocol
Policy design
Fleet and degradation
50 turbines, 11 component types
Weibull wear, latent heterogeneity
Kijima type II imperfect repair
Access model
4-state sea-state Markov chain
CTV / SOV limits, daily task cap
priority-ordered task queue
Evaluation design
2-yr burn-in, 3-yr window
common random numbers
disjoint training / test seeds
Algorithm 1
Iso-reliability operating points
frontier interpolation, local-slope correction
cost: |grid| × training seeds × one simulation
Algorithm 2
Frequency matching
fixed-point calibration of calendar intervals
≤ 7 iterations × 10 replicates
Algorithm 3
Attribution and inference
2 × 2 factorial contrasts, paired bootstrap
O(B R) per contrast, B = 20,000, R = 50
policies
2 × 2 attribution design
Learning of latent wear
none
Bayesian
Calendar
TBM
LTBM
State tracking
EAT
BAY/BAYe
Reference policies
TBMm: frequency-matched calendar
ORA: oracle bound (not implementable)
IDX, IDXL, PS, SEN: baselines
